### Description of discontinuation

The HEAVYCON housings listed above are being discontinued.

For the replacement products, a corrosion-resistant aluminum alloy was used. This renders an additional surface finishing (paint) superfluous. Thanks to this and to the use of conductive seal elements, the replacement products are EMC suitable. With IP66/67, the new housings feature higher degrees of protection (the discontinued products only featured IP65).

Instead of a metal locking latch, the replacement products have an all-plastic latch made of glass-fiber-reinforced polyamide, as this solution offers mechanical and haptic advantages.

The drilling and wall cut-out dimensions of the replacement products match those of the discontinued panel mounting frames and surface mounting housings.

Discontinued and new housings are mating compatible. The previously used housings can still be used.

The affected products and the corresponding replacement products are listed in the accompanying product list.

The visual difference between the housings is shown in the following illustrations.
