Function extension regarding the ME-IO housing: individual connectors are grouped together to form a block		
<p>The front connection technology of the ME-IO housing system allows individual HSCP-SP connectors to be removed. To achieve more flexibility in the ME-IO module design, it should be possible to combine individual connectors with each other. Overall connectors are created in this way offering a higher number of poles for the application. To this end, a block belt has been designed that enables individual connectors to be grouped together in order to form an overall connector. The side contour of the individual connector (not visible when installed) will be adapted on both sides to match the contour of the block belt.</p> <p>The dimensions of the connectors remain unchanged and they can still be used as individual connectors.</p>
